

# Glipizide Analyzed with HPLC - AppNote

# **Separation of API from Acid Degradation Products**

This Method illustrates the capabilities to separate several Glipizide Degradants that are formed under acidic conditions. Good separation is obtained as well as Sharp, Symmetric Peak shapes for each compound.

The Retention times show good repeatability as well, as demonstrated in the Figure overlays. Also, the Mobile Phase Solvents are LCMS compatible, which expands the potential applications of the Method. Finally, Gradient Equilibration is fast and requires only 1 Column volume.

#### Peaks:

- 1. Degradant
- 2. Degradant
- 3. Degradant
- 4. Glipizide

### **Method Conditions**

Column: Cogent Bidentate C18™, 4µm, 100Å

Catalog No.: 40018-75P Dimensions: 4.6 x 75mm

**Mobile Phase:** 

A: DI Water / 0.1% Formic Acid B: Acetonitrile / 0.1% Formic Acid

Injection vol.: 10µL Flow rate: 1mL / minute Detection: UV @ 225nm Sample Preparation:

Figure. A (Non-Degraded): 0.1mg / mL Glipizide in Methanol diluent.

Figure. B (Acid Degradation): 0.1mg / mL Glipizide in 50:50 Methanol /1N HCl diluent. Sample was

heated at 85°C for 1 hour.

**to:** 0.9 minutes

Note: Glipizide is an anti-diabetic sulfonylurea drug, sold under the trade name Glucotrol®.
